

## Homework 3

To this [contract](#)

1. Add a variable to hold the address of the deployer of the contract
2. Update that variable with the deployer's address when the contract is deployed.
3. Write an external function to return
  1. Address `0x000000000000000000000000000000000000dEaD` if called by the deployer
  2. The deployer's address otherwise
